DEVELOPMENT OF FULL SEISMIC WAVEFORM INVERSION

DEVELOPMENT OF FULL SEISMIC WAVEFORM INVERSION

MOTIVATION: THE SCALE-DEPENDENCE OF SEISMIC TOMOGRAPHY

Unresolvable small-scale structure may lead to incorrect images of large-scale structure.

MOTIVATION: THE SCALE-DEPENDENCE OF SEISMIC TOMOGRAPHY

Unresolvable small-scale structure may lead to incorrect images of large-scale structure.

- **small-scale isotropic crustal structure trades off with large-scale anisotropy**
 - discrepant inferences on strength, depth-extent and sign of anisotropy

MOTIVATION: THE SCALE-DEPENDENCE OF SEISMIC TOMOGRAPHY

Unresolvable small-scale structure may lead to incorrect images of large-scale structure.

- small-scale isotropic crustal structure trades off with large-scale anisotropy
- discrepant inferences on strength, depth-extent and sign of anisotropy

Global tomography with fixed crustal structure

radial anisotropy @ 100 km depth, $(v_{sh}-v_{sv})/v_s$

crustal model: CRUST2.0

crustal model: 3SMAC

crustal model: CRUST07

MOTIVATION: THE SCALE-DEPENDENCE OF SEISMIC TOMOGRAPHY

Unresolvable small-scale structure may lead to incorrect images of large-scale structure.

- **small-scale isotropic crustal structure** trades off with **large-scale anisotropy**
 - discrepant inferences on strength, depth-extent and sign of anisotropy
- **small-scale (near-receiver) velocity structure** trades off with **large-scale Q structure**
 - low correlation between various 3D attenuation models

MOTIVATION: THE SCALE-DEPENDENCE OF SEISMIC TOMOGRAPHY

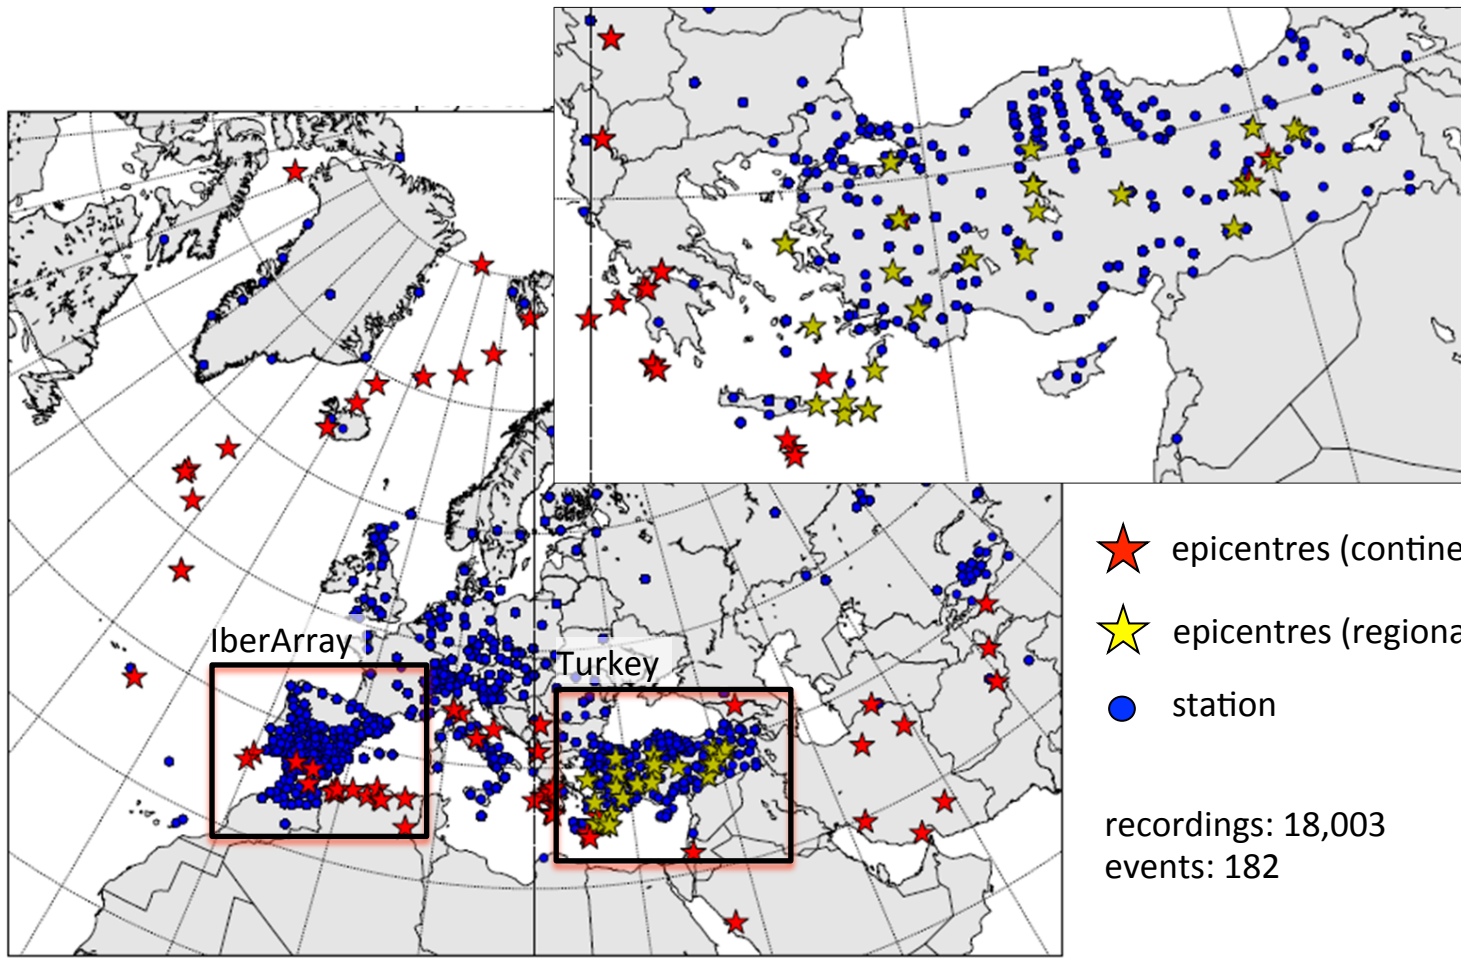

Unresolvable small-scale structure may lead to incorrect images of large-scale structure.

Necessary improvements

- **Accurate seismic modelling and inversion in complex 3D media**
 - avoid crustal corrections
 - exploit as much waveform information as possible

- **Simultaneous inversion for crustal and mantle structure**
 - constrain small-scale heterogeneity as much as possible
 - reduce small-to-large-scale trade-offs (improve resolution)

MULTI-SCALE INVERSION

MULTI-SCALE INVERSION

Simultaneous inversion of:

- longer-period waves on the continental scale (upper mantle)
- shorter-period waves on smaller scales (crust)
- Involves non-periodic homogenisation for upscaling small-scale structure.

MULTI-SCALE INVERSION

Forward problem

- Spectral elements (SES3D)

Inversion

- Fréchet kernels via adjoint techniques
- Conjugate gradient optimisation
- 53 iterations

Embedded sub-regions (higher frequencies)

- Anatolia
- North Atlantic
- Western Mediterranean

 Sub-regions for higher-frequency modelling and inversion

RESOLUTION ANALYSIS

Second-order adjoints to compute point-spread functions: $H \cdot \delta m$

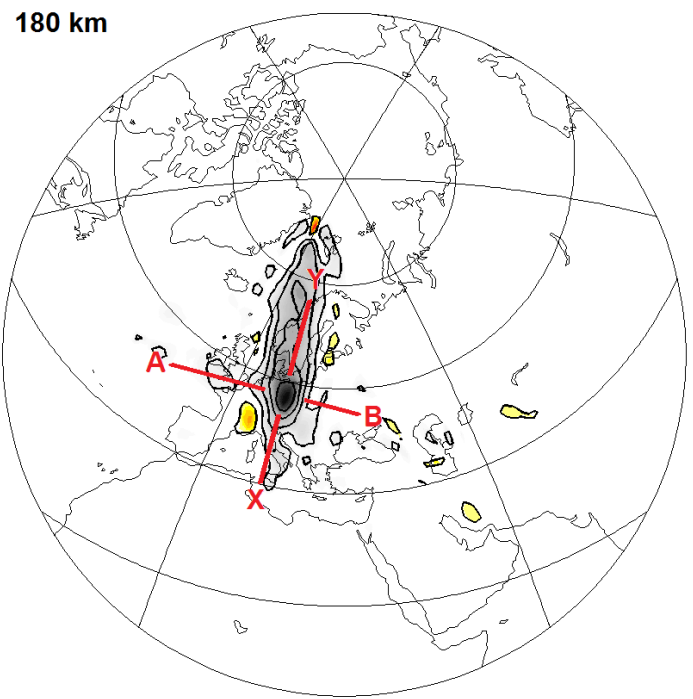

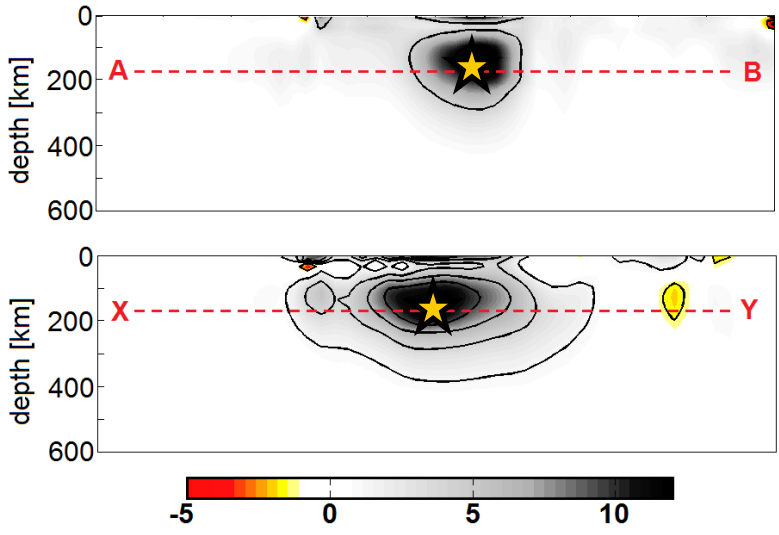

↑ ↑
Hessian point-localised
perturbation

RESOLUTION ANALYSIS

Second-order adjoints to compute point-spread functions: $H \cdot \delta m$

Example:

δm = point-localised S velocity perturbation at 

RESOLUTION ANALYSIS

Second-order adjoints to compute point-spread functions: $H \cdot \delta m$

Example:

δm = point-localised S velocity perturbation at 

- continuous version of 1 column of the Hessian
- not symmetric
- direction-dependent width defines resolution lengths

RESOLUTION ANALYSIS

Direction- and position-dependent resolution length (Fichtner and Trampert, 2011a,b)

- computed via second-order adjoints

continental-scale resolution

regional-scale resolution (colour scale adapted)

RESOLUTION ANALYSIS

Direction- and position-dependent resolution length (Fichtner and Trampert, 2011a,b)

- computed via second-order adjoints

continental-scale resolution

50 km

regional-scale resolution (colour scale adapted)

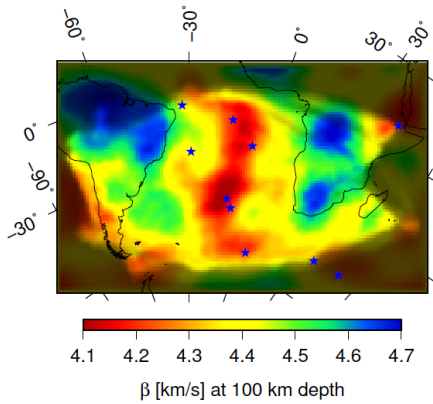

Crustal depth matches receiver function results (Vanacore et al., GJI 2013)

Inter-station Greens functions match noise correlations (**not used to construct the model!**)

BEYOND EUROPE

Stephoe et al. (in prep.)

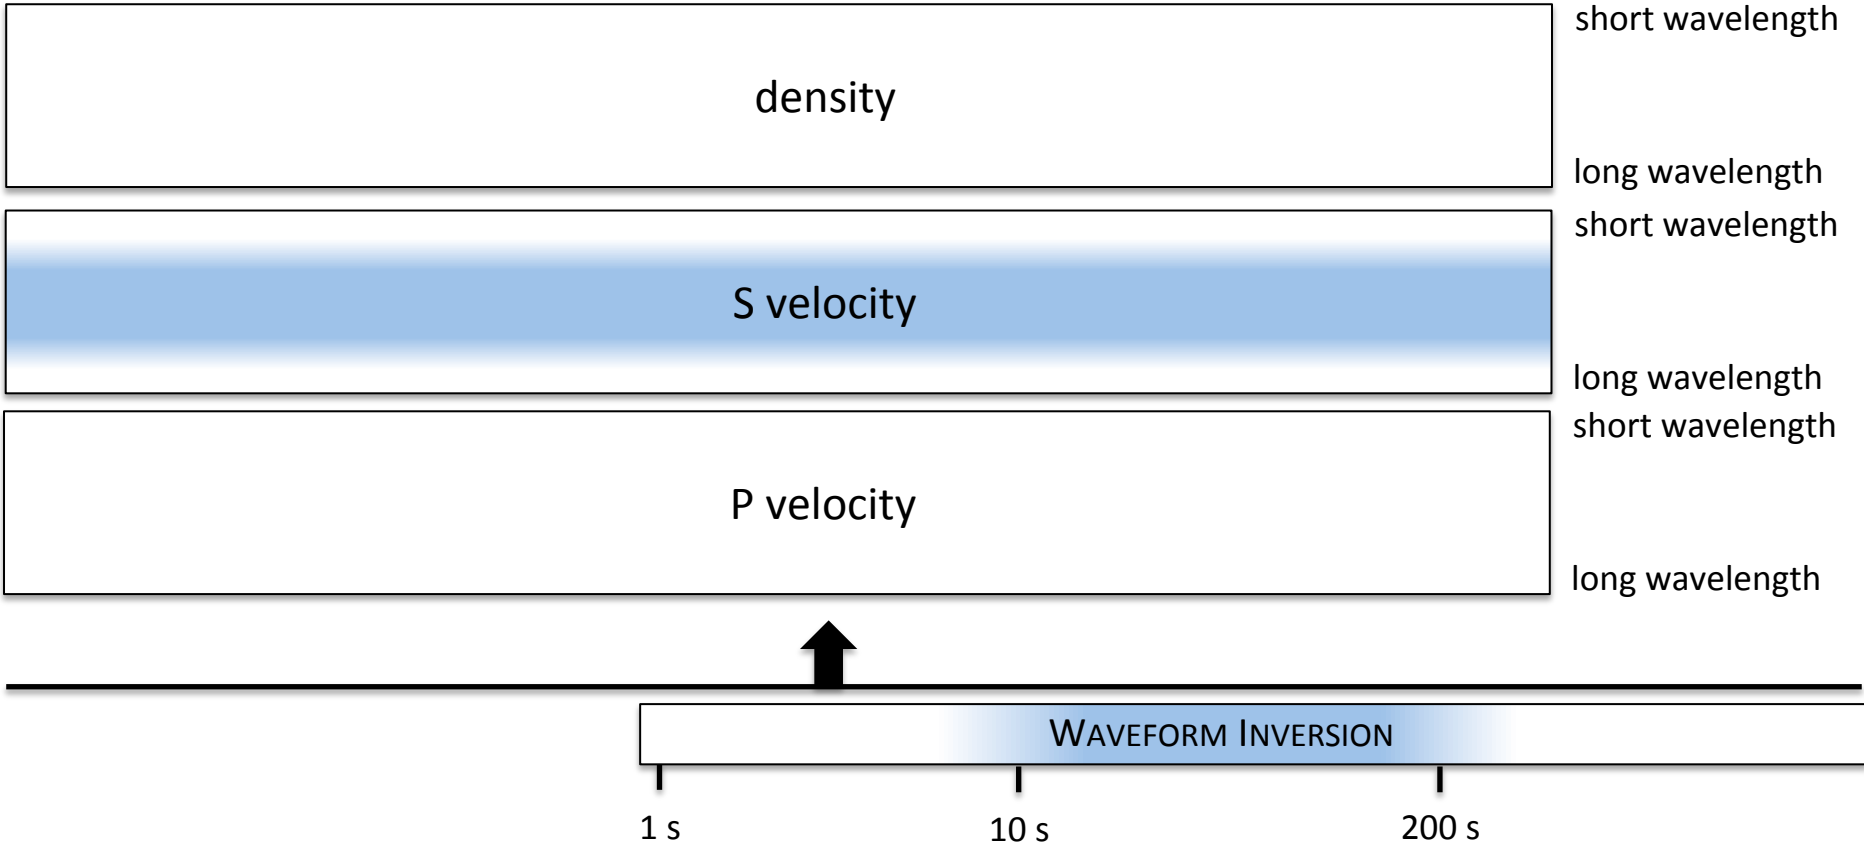

joint with LMU
Colli et al. (in press.)

joint with LMU & U. Michigan
Krischer et al. (initial phase)

FUTURE PLANS

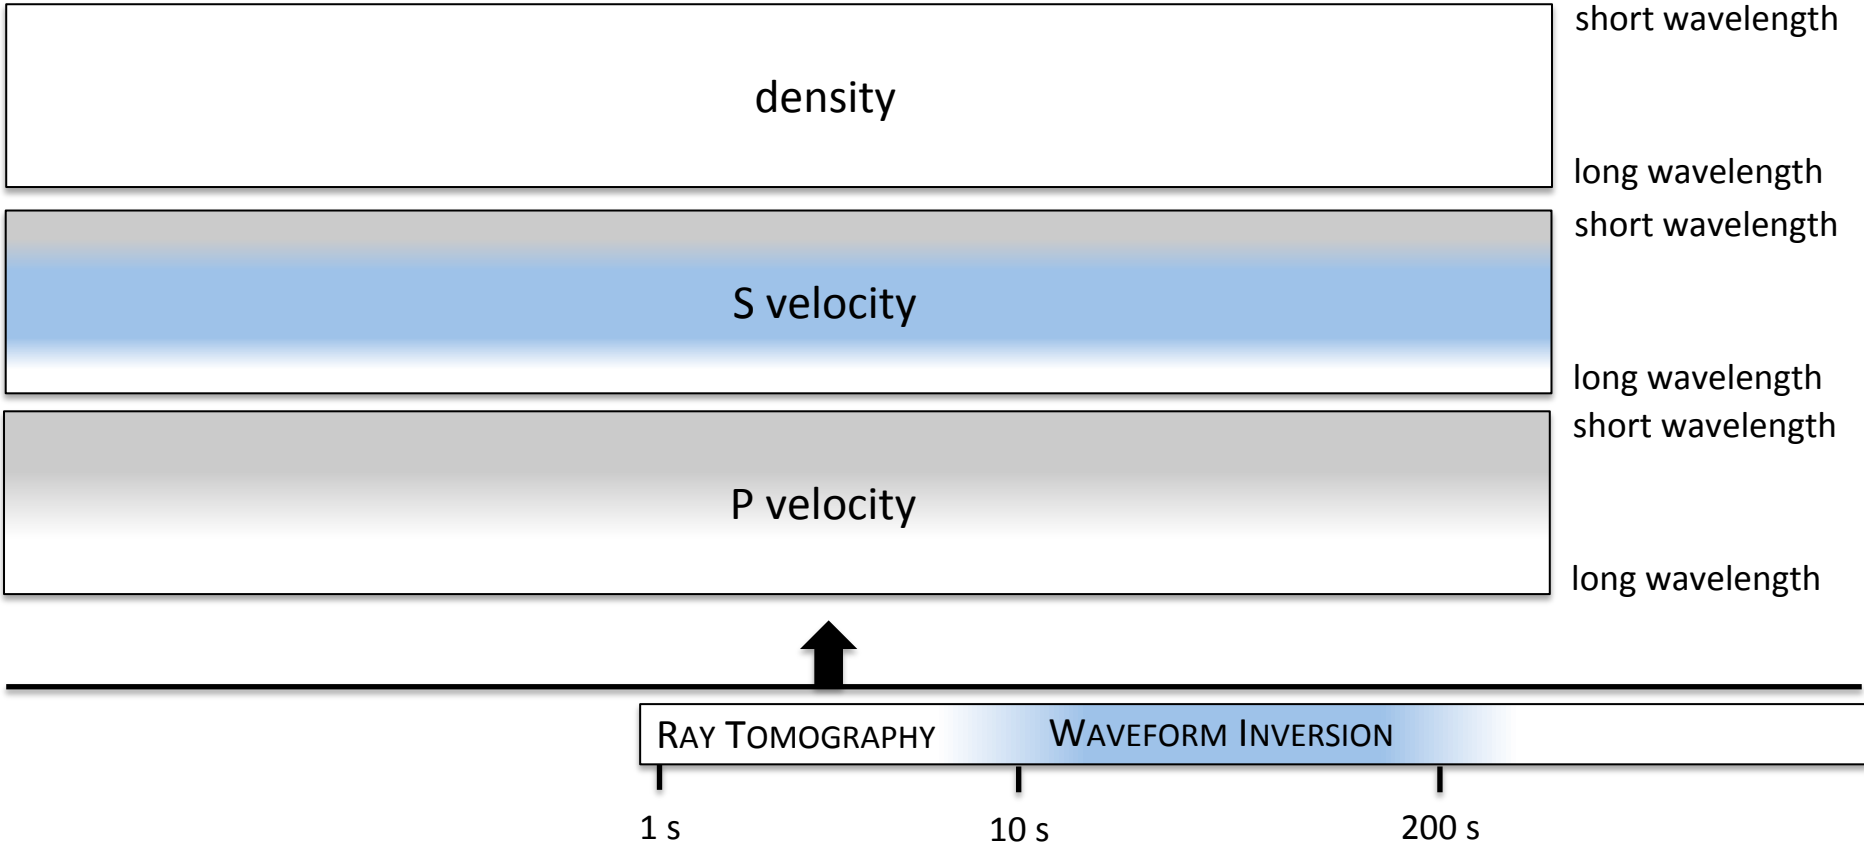

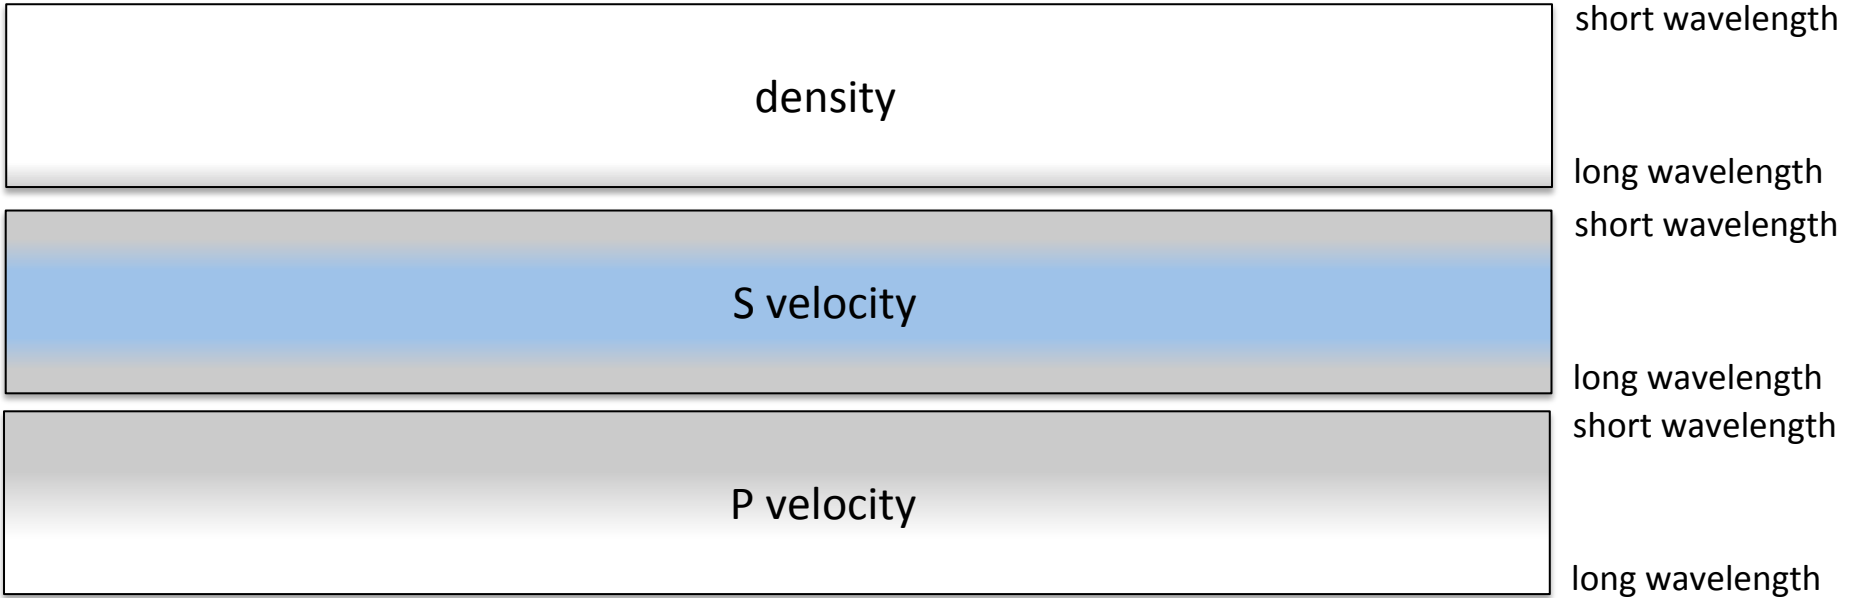

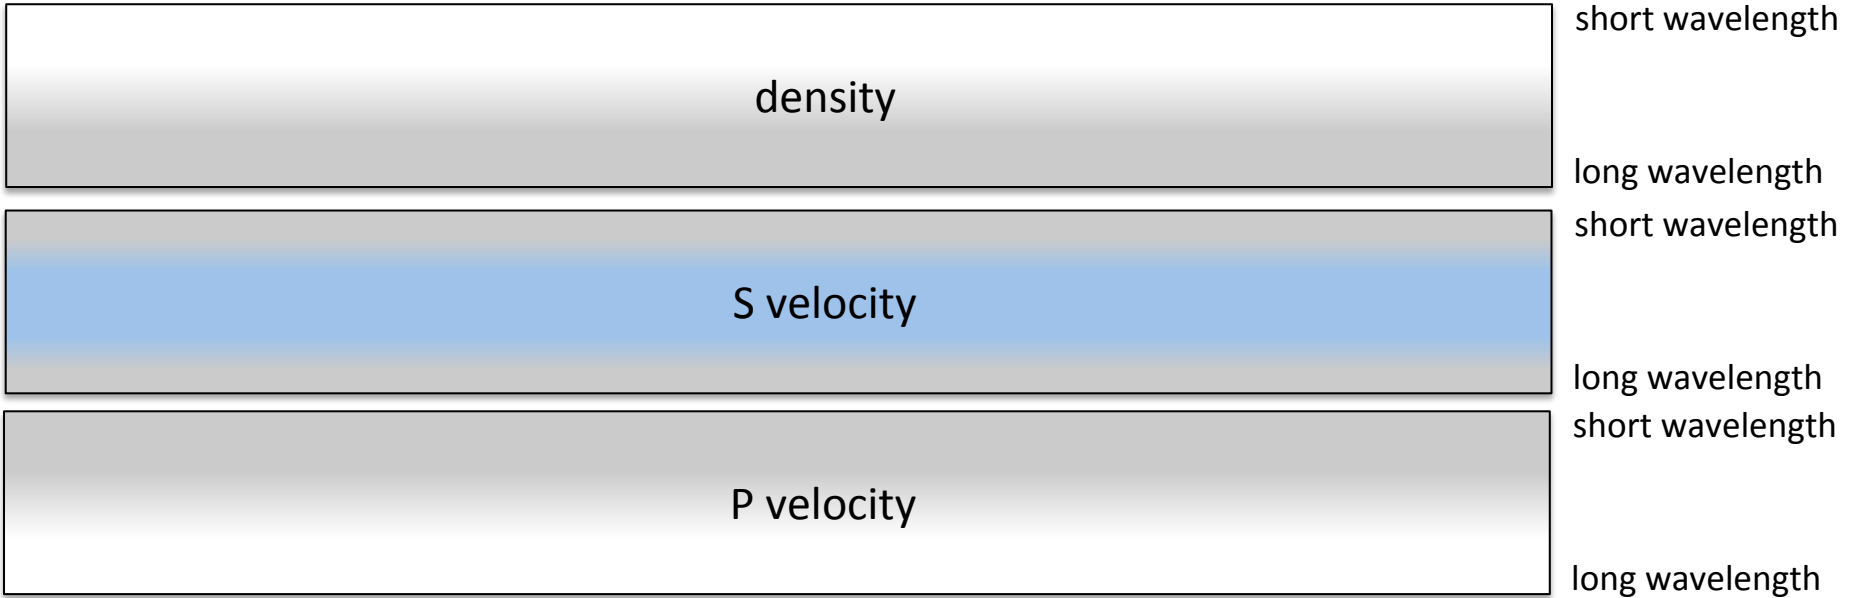

≈ 50,000 times (order of magnitude) more expensive than inversion at 10 s.

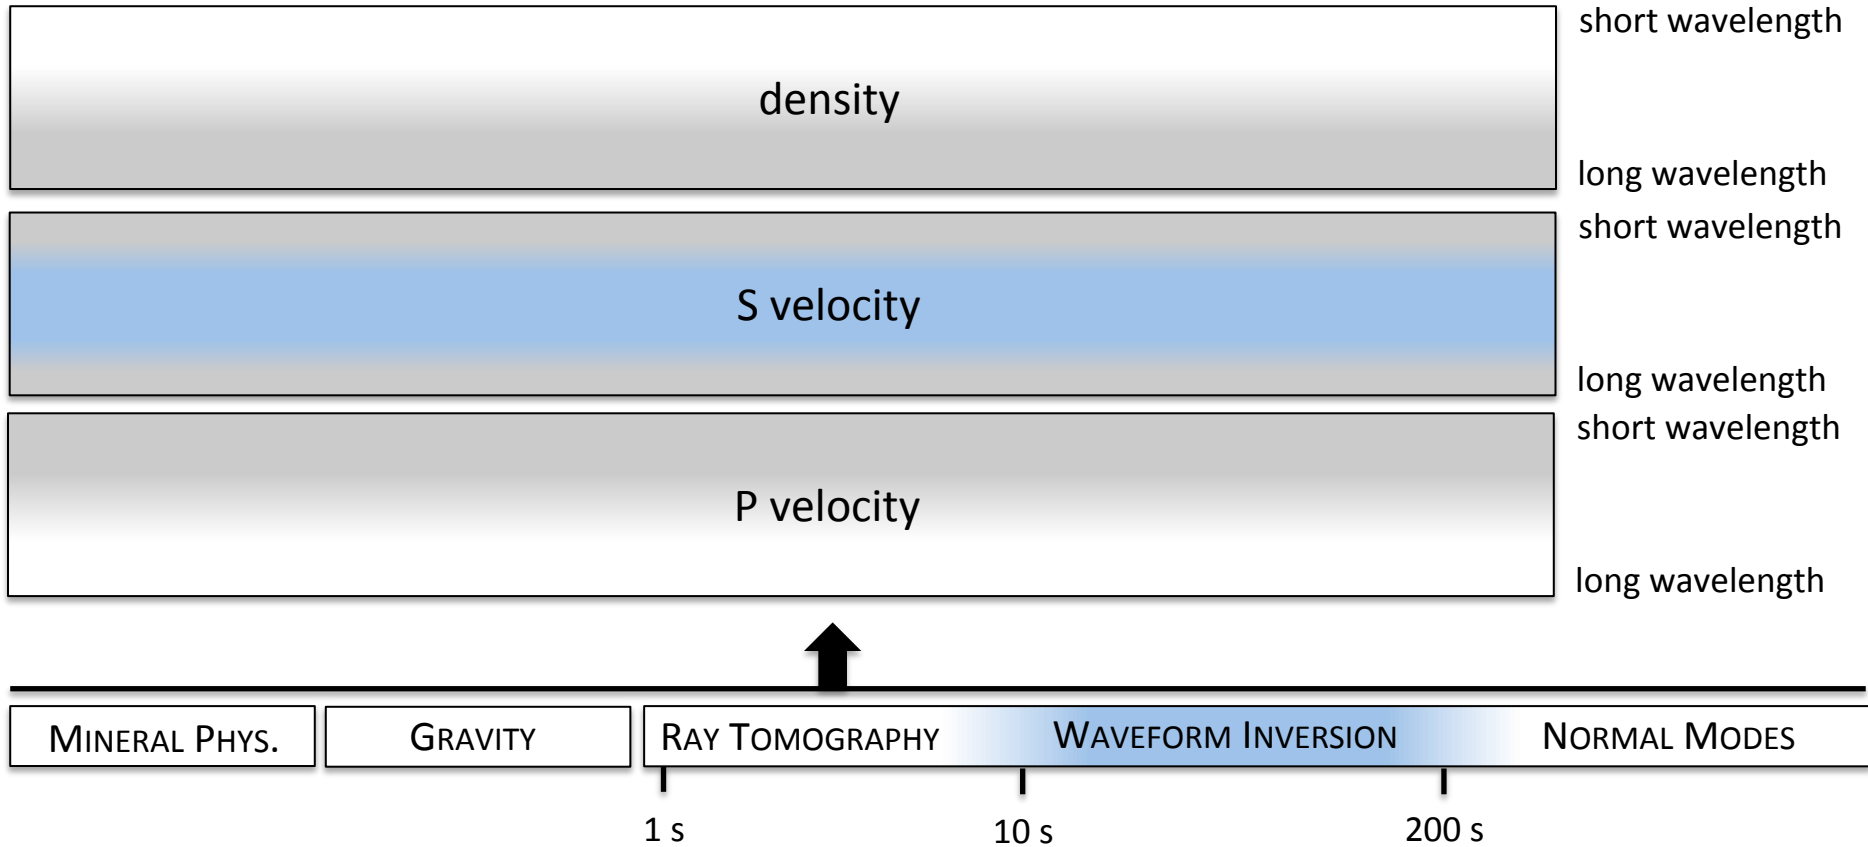

We may do it in ≈ 20 years. (Assuming Moore's law, which does not mean much in practice.)

Would require tens of 1 Megawatt power plants. (unless energy efficiency improves)

Towards a comprehensive Earth model ...

Thanks for your attention!
